

Polynomial Regression lab

Task 1:

In this lab you should use PR model in order to predict the salary of a person A who is interviewed to a company. The company has a net to calculate the salaries of its employees depending on their level. The person A has a level of 6.5. Your aim is to predict his salary.

Task 2:

You should use the PR model on a dataset that you've been working before this lab (choose any) OR you can find a completely new one.

As usual, provide the JP notebook/script and a report with the explanations.
